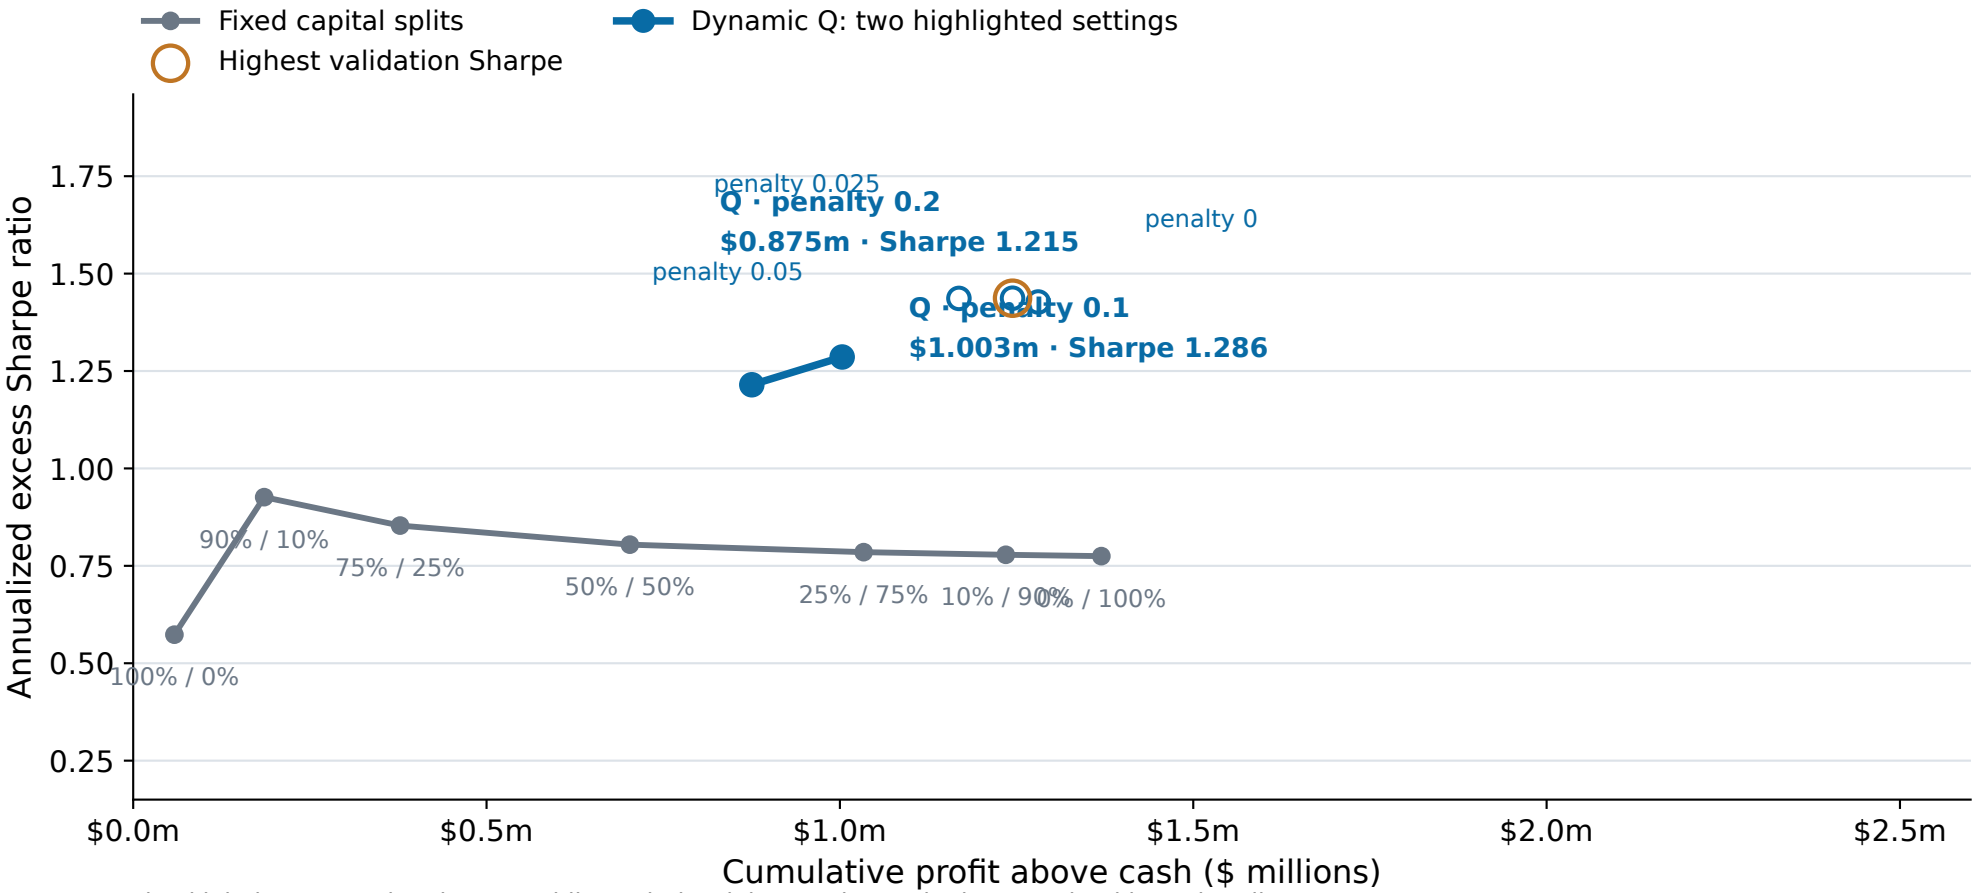
Dynamic Q versus fixed capital allocation

2018–2021 validation · Discount γ = 0.99



Fixed labels = put-pair / short-straddle capital weights. Both use the best retained inner bandits.

Same total budget and resizing-cost model; Q changes the split weekly. Lines only connect measured settings.

Full Q sweep shown; gold ring marks the highest-validation-Sharpe setting.

Previously researched historical periods. Strategy-index allocation, rather than a shared integer-contract inventory replay.
